BYD’s Rapid Growth in the UK Market: Can It Last?

A Scenario Analysis Based on Public Data

Zishun Gao

October 2026 · Data as at 20 October 2026

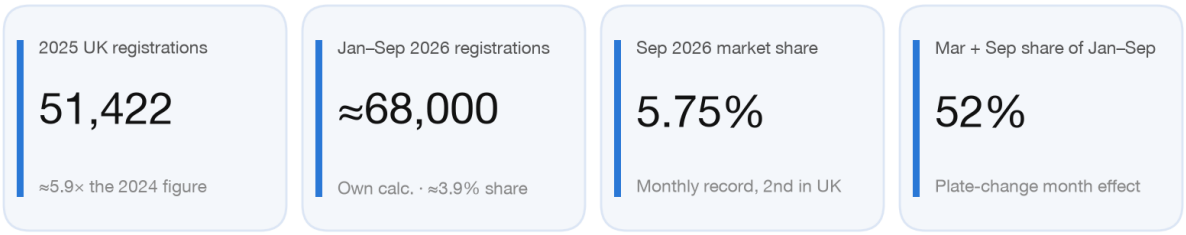

Executive Summary

This report examines whether BYD's rapid growth in the UK market can continue, and for how long. BYD entered the UK passenger car market in March 2023. In 2025 its UK registrations reached 51,422 vehicles, about 5.9 times the previous year's figure; registrations for January–September 2026 were about 68,000 vehicles, and full-year growth is expected to be about 70% (author's calculation). Drawing on BYD company announcements, SMMT registration data as cited in the media and UK government policy documents, the report analyses four areas: market performance, growth drivers, policy risks and product pricing.

The analysis shows that BYD's growth in the UK is real but highly concentrated in the two plate-change months of March and September, which together account for 52% of registrations in January–September 2026. September's single-month market share of 5.75% therefore does not represent the full-year level, and the full-year share is more likely to be around 4%. The growth depends to a large extent on external conditions: the UK has not followed the EU in imposing additional tariffs on Chinese-made electric vehicles, the ZEV mandate has prompted other manufacturers to promote electric vehicles with discounts, and plug-in hybrid models can be sold in the UK until 2035. At the same time, the main risks also come from policy. They include the fact that the Electric Car Grant (ECG) does not cover any BYD model, the possibility that the ZEV 2030 target may be lowered from 80% to 50%, and the UK government's ongoing study of additional tariffs on Chinese-made electric vehicles.

Because these policy directions are hard to predict, this report does not make judgements about government decisions. Instead, it builds optimistic, base and pessimistic scenarios and proposes five early signals that can be tracked monthly. The report concludes that BYD's growth in the UK is likely to continue through the end of 2027, but at a markedly slower pace, with market share stabilising at around 4% in the base scenario. On product strategy, BYD's sales are concentrated in plug-in hybrid SUVs priced at £24,000–£40,000, which closely match mainstream UK consumer demand. The report recommends that BYD UK hold the mid-priced segment while using differentiated technologies such as ultra-fast charging and intelligent driving to support product value, avoiding a purely price-based contest.

The accompanying Power BI dashboard (Appendix A) turns this analysis into a monitoring tool that can be updated monthly.

Chapter 1 Introduction

In recent years Chinese car brands have expanded rapidly in Europe, and the UK, which has not imposed additional tariffs on Chinese-made electric vehicles, has become one of their fastest-growing markets. BYD is the most representative company in this trend: less than three years after entering the UK, its cumulative sales exceed 100,000 vehicles, and in September 2026 it ranked second among brands in the UK with 20,140 registrations. Behind this rapid growth, however, lie seasonal volatility, policy uncertainty and increasingly intense competition, and whether the growth can continue bears directly on BYD UK's business planning.

The research question of this report is whether BYD's rapid growth in the UK market can continue, and for how long. On this basis, the report also discusses a related strategic question: whether BYD in the UK should continue to rely mainly on its price advantage or gradually move towards higher price points and stronger technological differentiation.

The report is structured as follows. Chapter 2 describes the data sources, confidence levels and data limitations. Chapter 3 describes BYD's market performance in the UK and the plate-change month effect. Chapters 4 and 5 analyse the growth drivers and the main risks respectively. Chapter 6 builds three scenarios and proposes early signals. Chapter 7 uses model price data to discuss BYD's product positioning and pricing strategy, with a comparison with Tesla. Chapter 8 presents conclusions and recommendations, and Chapter 9 discusses the limitations of the study. Appendix A introduces the accompanying Power BI dashboard.

Chapter 2 Data and Methods

The data in this report come mainly from four types of source. The first is BYD's company data, including annual reports, interim reports, monthly sales announcements and official BYD UK press releases (BYD UK Media, 2026a; BYD UK Media, 2026b; Zhang, 2026a). The second is UK new car registration data, published monthly by the Society of Motor Manufacturers and Traders (SMMT); because brand-level detail is available only by payment or registration, this report uses SMMT press releases (SMMT, 2026a; SMMT, 2026b; SMMT, 2026d) and SMMT data as cited in the media (Stanbrook, 2026; McLoughlin,

2026). The third is policy material, including the ZEV mandate consultation and response documents published on GOV.UK (DfT, 2023; DfT, 2025; DfT, 2026a), the European Commission's tariff announcement (European Commission, 2024), the official ECG page (OZEV, 2025) and interpretation by the trade body BVRLA (BVRLA, 2026). The fourth is trade media reports and think-tank analysis, such as CnEVPost, Reuters, electrive, T&E and Bruegel. This report uses the Harvard (author–date) referencing style; the full reference list appears at the end, and all web pages were accessed on 25 October 2026. The data workbook BYD_Data_Collection_2026-10-20.xlsx retains the original source numbers (S01–S46).

To distinguish the reliability of the data, this report classifies all data into three confidence levels (Table 2-1). Among these, UK registrations for 2023 and 2024, UK registrations for January–September 2026, the monthly data for January–February, April and July 2026, and all shares and full-year forecasts are derived by the author from public data and are marked in the text with "(author's calculation)". Lower-confidence estimates are marked "(estimate)", and content for which no primary source has yet been found is marked "(to be verified)".

Table 2-1 Data confidence levels

Level	Definition	Examples
High	Company announcements or primary data	BYD 2025 annual report; BYD UK September press release
Medium	Reliable secondary reports	SMMT data cited in the media
Low	Estimates or single-source data	UK registrations for 2023; 2026 full-year forecast

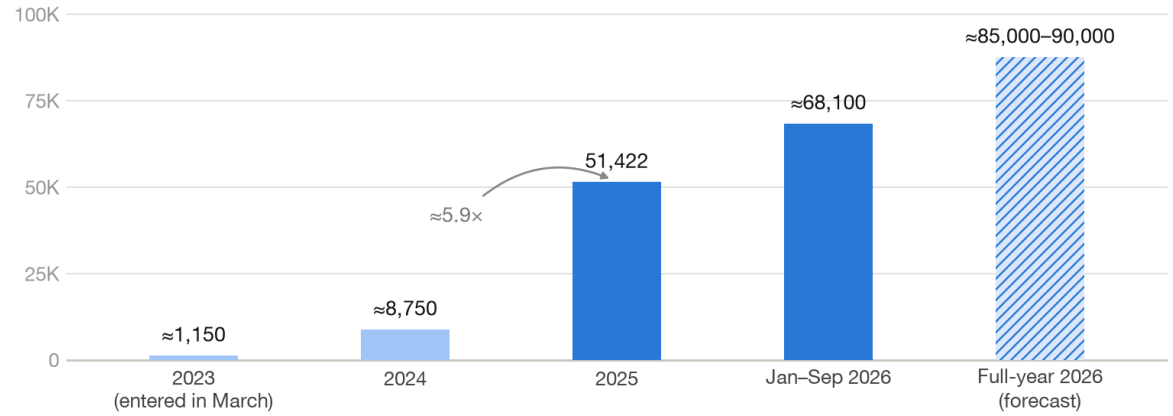

The available data have several limitations. The SMMT has not published complete monthly brand-level data for 2026, so January–February can only be estimated together, and the July figure is derived by back-calculation. Public sources also lack a complete breakdown of BYD UK's battery-electric and plug-in hybrid sales (only battery-electric sales of 12,754 vehicles for January–April are available; The EV Report, 2026a), as well as a split between fleet customers and private buyers. In addition, sources differ in their records of first-half 2026 registrations: the BYD UK official press release gives 37,995 vehicles (BYD UK Media, 2026a), whereas some media reports and the sum of the monthly data give 37,795 (eletric-vehicles.com, 2026b). The difference of about 200 vehicles may stem from error in the back-calculated April figure. This report uses the official figure of 37,995 vehicles. The Department for Transport's quarterly vehicle registration statistics (DfT, 2026b) can be used to cross-check the size of the whole market, but the text of the release does not report BYD separately.

Chapter 3 BYD's Market Performance in the UK

BYD's UK registrations grew dramatically within three years (Figure 1, Table 3-1). In 2023, the year it entered the market, registrations were about 1,150 vehicles; in 2024 they rose to about 8,750; and in 2025 they reached 51,422, about 2.5% of the UK new car market (author's calculation; SMMT, 2026a). Registrations for January–September 2026 were about 68,100 vehicles, a market share of about 3.9%. If the fourth quarter is calculated at the 2026 non-plate-month average (5,000–6,500 vehicles per month), full-year registrations are projected at 85,000–90,000 vehicles (author's calculation); this forecast is only a rough estimate.

Figure 1 BYD UK new-car registrations, 2023–2026

From about 1,000 cars to a forecast near 90,000 in three years; light bars are estimates, hatched bar is forecast

Sources: BYD UK Media, SMMT, press reports; 2023, 2024 and 2026 figures are author's calculations or estimates (low confidence)

Table 3-1 Data for Figure 1

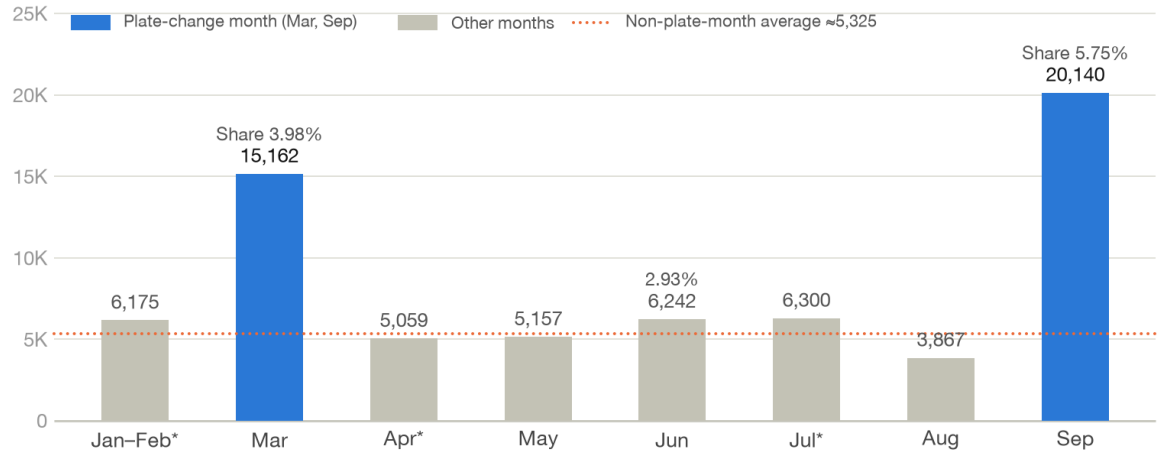

Year	Registrations (vehicles)	Source	Confidence level
2023 (entered the UK in March)	About 1,150	Back-calculated from 658% growth in 2024 (Fleet News, n.d.; author's calculation)	Low
2024	About 8,700–8,800	8,700 per (Fleet News, n.d.); 8,788 back-calculated from (Batchelor, 2026)	Medium
2025	51,422 (about 2.5% of the UK market)	(Batchelor, 2026)	High
January–September 2026	About 68,100 (about 3.9%)	(BYD UK Media, 2026b); (Cathay EV, 2026) (author's calculation)	Low
Full year 2026 (forecast)	About 85,000–90,000	Author's calculation	Low

In terms of growth rate, BYD's growth has slowed but remains high. Year-on-year growth was about 485% in 2025 and about 95% in the first half of 2026, and growth for January–August was 98% (Cathay EV, 2026); on the full-year forecast, growth in 2026 is about 65%–75% (author's calculation). As the base expands, the growth rate naturally falls. Regionally, the UK is BYD's largest single market in Europe: in the first half of 2026, BYD registered 174,144 vehicles in Europe (the EU, the European Free Trade Association and the UK) (eletric-vehicles.com, 2026c), of which the UK accounted for about 22% (author's calculation).

The monthly data reveal a clear seasonal pattern (Figure 2, Table 3-2). New number plates are issued in the UK every March and September, and much of the demand for new cars is concentrated in these two months (Doyle, 2026a). The SMMT notes that new-plate months typically account for about one-seventh of annual registrations (SMMT, 2026d), and that March is the busiest month of the year (SMMT, 2026b). In March and September 2026 BYD registered about 35,300 vehicles in total, 52% of registrations for January–September (author's calculation). By contrast, performance in non-plate months better reflects BYD's underlying competitiveness: its market share in June was only 2.93% (Stanbrook, 2026), well below September's 5.75%. When assessing BYD's real competitiveness, therefore, non-plate-month data should be the main basis, and September's single-month share must be adjusted for seasonality before it can be used to judge the full-year level.

Figure 2 BYD UK monthly registrations, 2026

March and September, the two plate-change months, gave about 52% of Jan–Sep sales; grey months show true competitiveness

Sources: BYD UK Media, SMMT, press reports; * back-calculated figures (author's calculation)

Table 3-2 Data for Figure 2

Month	Registrations (vehicles)	Market share	Source and notes
January–February	About 6,175	—	Q1 total of 21,337 minus March's 15,162 (author's calculation)
March (plate-	15,162	3.98%	(McLoughlin, 2026; Electric & Hybrid Vehicle

Month	Registrations (vehicles)	Market share	Source and notes
change month)			Technology International, n.d.)
April	About 5,059	—	January–April total of 26,396 minus Q1 (author's calculation)
May	5,157	—	(EVStats, 2026)
June	6,242	2.93%	(Stanbrook, 2026; eletric-vehicles.com, 2026b)
July	About 6,300	—	Back-calculated from "over 48,000 vehicles" for January–August (author's calculation, low confidence level)
August	3,867	—	(EVStats, 2026) (August is the low season for the UK car market)
September (plate-change month)	20,140	5.75%	(BYD UK Media, 2026b) (the initial press release gave 20,129)
January–September	**About 68,100**	**About 3.9%**	Author's calculation

One possible hypothesis is that colder winter temperatures reduce electric vehicle range and so suppress purchases. The available data, however, show that low registrations in January–February arise mainly because the overall UK car market is small in this period and consumers tend to wait for the March new plate, rather than because demand for electric vehicles is particularly weak. With only one year of monthly data, it is not yet possible to fully separate the winter effect from the plate-change month effect; this can be tested further once the dashboard has been supplemented with monthly data for 2024–2025.

Chapter 4 Growth Drivers

BYD's rapid growth in the UK owes much, first, to the difference between UK and EU tariff policy. Since 2024 the EU has imposed countervailing duties on Chinese-made battery-electric vehicles; the rate applicable to BYD is about 17% (European Commission, 2024), in addition to the 10% ordinary tariff (to be verified). The UK currently charges only the ordinary import tariff, and a government spokesperson has confirmed that there are "no tariffs on Chinese electric vehicles" (Reuters, 2026). This difference makes BYD markedly more price-competitive in the UK than in the EU market, and is an important reason why the UK has become BYD's largest market in Europe. T&E's analysis shows that, at the 17% rate, BYD's imports of battery-electric vehicles into the EU have in fact more than doubled (Transport & Environment, 2026a); CSIS notes that BYD's rate is below the 45%–55% range that could make the EU market commercially unattractive (Reinsch and Whitney, 2024).

Second, the ZEV mandate has driven the overall expansion of the UK electric vehicle market. Under the regulation, zero-emission models must account for 28% of new cars a manufacturer sells in the UK in 2025, 33% in 2026, 80% in 2030 and 100% in 2035 (DfT, 2023; DfT, 2025). Manufacturers that fall short can comply through mechanisms such as credit trading, failing which they must pay a penalty of £12,000 per vehicle (reduced from £15,000 in April 2025). The battery-electric share in the UK for January–September 2026 was 26.2% (SMMT, 2026d; eletric-vehicles.com, 2026a), still short of the 33% target, so other manufacturers have stepped up discounting of electric vehicles, expanding the electric vehicle market as a whole; in September, UK battery-electric registrations set a record of 99,199, a share of 28.3% (eletric-vehicles.com, 2026a). BYD has a high proportion of battery-electric models and therefore faces relatively little pressure to comply, and could in theory sell surplus credits to other manufacturers, but there are currently no public data on BYD UK selling credits (inference).

Third, a product mix that runs battery-electric and plug-in hybrid models in parallel has widened BYD's customer coverage. In the first half of 2026, the plug-in hybrid SUV Seal U DM-i was BYD's best-selling model in the UK and also the best-selling plug-in hybrid in the UK (BYD UK Media, 2026a). In April 2025 the UK postponed the ban on selling hybrid models until 2035 (DfT, 2025), so plug-in hybrid models still have about nine years of market space. They can attract consumers who remain wary of battery-electric vehicles, and can also act as a buffer if policy on battery-electric vehicles changes.

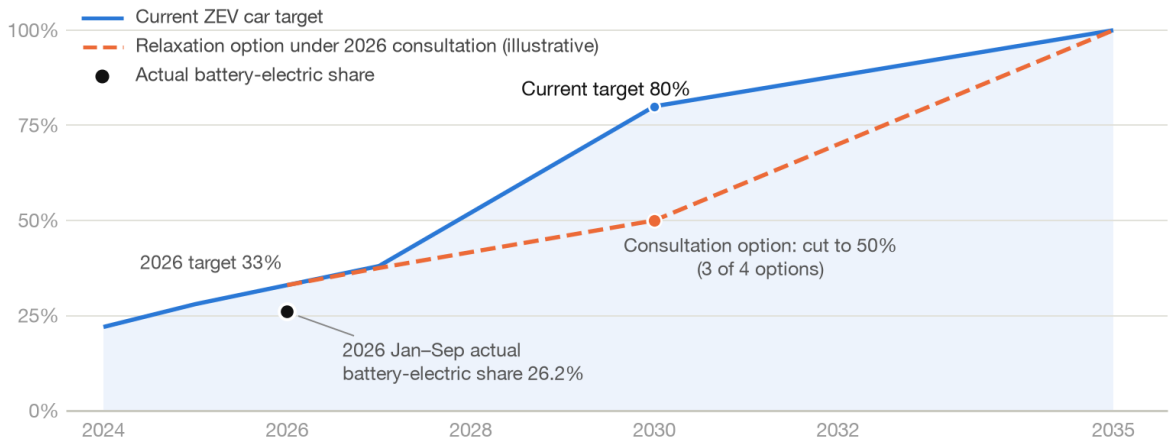

In addition, the rapid expansion of the sales network provides a foundation for sales growth. BYD UK's retail outlets increased from 5 in 2023 to 125 at the end of 2025, and further to 143 in 2026 (The EV Report, 2026b; Fleet News, 2023). Finally, strategic support from the parent company is also an important factor. In January–September 2026, BYD's domestic sales in China fell by 30% while overseas sales grew by 93%; overseas sales now account for about 43% of total sales and 52.6% of first-half operating revenue (Zhang, 2026b; Zhang, 2026c; Opletal, 2026). Overseas markets have become the main driver of BYD's recovery in performance, so the parent company has a strong incentive to keep investing in the UK and other overseas markets.

Chapter 5 Risks to Growth

The primary risk BYD faces in the UK is a possible relaxation of the ZEV mandate. From 14 August to 23 October 2026, the UK government held a public consultation on the ZEV mandate (DfT, 2026a; BVRLA, 2026); three of the four options lower the 2030 target from 80% to 50%, while the final 2035 target remains unchanged, and the outcome is expected to be announced in early 2027 (Figure 3). If the target is lowered, pressure on other manufacturers to promote electric vehicles will ease, discounting will weaken accordingly, BYD's relative price advantage may be eroded, and the value of ZEV credits will also fall.

Figure 3 UK ZEV mandate: targets, actuals and possible relaxation

The market is short of the 33% target for 2026; a 50% target in 2030 would clearly ease pressure on carmakers

Sources: GOV.UK ZEV consultation, BVRLA, press reports; 2027–2029 targets not verified one by one; orange-line years are illustrative, not official

The second risk comes from the ECG grant. Introduced in July 2025, the grant provides a discount of £1,500 or £3,750 on battery-electric vehicles priced at no more than £37,000 (OZEV, 2025), but its scoring criteria focus on carbon emissions from the production process. As of October 2026, no model from a Chinese brand is among the approved vehicles (OZEV, n.d.; Hammond, 2026a), and in November 2025 the government added a further £1.3 billion to the budget, extending the grant to the 2028–29 financial year. This means that over the next two to three years, comparable battery-electric models from brands such as Renault, Kia and Ford may in effect be priced up to £3,750 lower than BYD's. BYD's current response is mainly to offer five years of free servicing and to extend the battery warranty to eight years or 200,000 km.

The third risk is that the UK may impose additional tariffs on Chinese-made electric vehicles, which is also the fastest-changing risk. On 4 October 2026, The Times reported that UK ministers were studying additional tariffs, possibly at a rate aligned with the EU's maximum of about 45%; when Reuters republished the report, it said it could not immediately verify it (Reuters, 2026). Reports by Sharecast and Carwow likewise mention that ministers are weighing tariff options, and note that no tariffs have yet been introduced (Chiou, 2026; Doyle, 2026b). A government spokesperson said that no tariffs are currently imposed and that the government will continue to engage with industry; at the time of writing there is no decision or timetable. It is worth noting that the EU's additional tariffs apply only to battery-electric vehicles, so if the UK followed the EU approach, the impact on BYD's plug-in hybrid models might be relatively small (inference). On the other hand, BYD's plant in Szeged, Hungary is expected to start production at the end of 2026; if vehicles built in Europe meet UK and EU rules of origin, they may not be affected by tariffs aimed at Chinese-made vehicles, so local production could reduce tariff risk to some extent, although the actual effect depends on the rules of origin and on the capacity the plant can allocate to the UK market (inference, to be verified).

The fourth risk is intensifying competition. In the first quarter of 2026, Chinese brands already accounted for about 11% of the UK new car market (McLoughlin, 2026; Electric & Hybrid Vehicle Technology

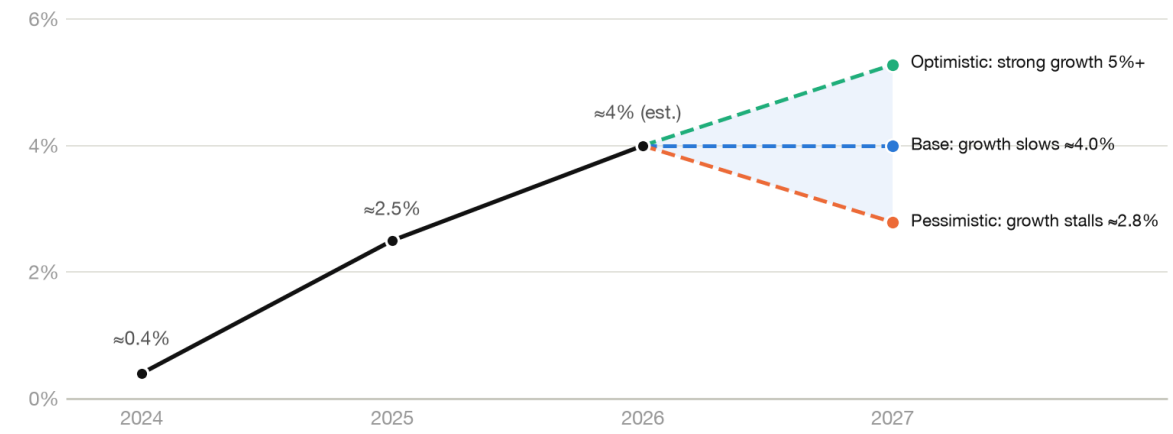

International, n.d.). Brands such as MG, Chery's Jaecoo and Omoda, and Leapmotor compete with BYD for similar customer groups, and the Jaecoo 7 ranked third among UK models by sales in January–July 2026 with 26,549 vehicles (IOL, 2026). Tesla registered 15,875 vehicles in the UK in September 2026, nearly double the previous year's figure (eletric-vehicles.com, 2026a), so competitive pressure from it is also rising. For the whole of 2025, Chinese brands already accounted for 9.7% of UK new car registrations (Batchelor, 2026); T&E's UK branch notes that the UK accounts for about 8% of Chinese battery-electric vehicle exports and that about one in every three battery-electric vehicles in the UK is made in China (Transport & Environment, 2026b); in the EU, about a quarter of the electric vehicles sold in 2024 were made in China (Tagliapietra et al., 2025). Finally, profit pressure at the parent company may also affect the UK business indirectly. BYD's net profit fell by 19% in 2025 and by a further 20.5% in the first half of 2026, mainly because of domestic price competition and foreign-exchange losses (Zhang, 2026a; Zhang, 2026b). Overseas business is currently an important source of profit, so the parent company is unlikely to cut overseas investment, but if profits keep declining, marketing budgets and pricing room in overseas markets may be constrained.

Chapter 6 Scenario Analysis

Since these risks depend mainly on government decisions, this report does not forecast policy outcomes. Instead, it builds three scenarios, setting out the signals that might be observed if each occurs and the preparations BYD UK could make (Figure 4, Table 6-1). In the optimistic scenario, the ZEV target is largely unchanged and the UK imposes no additional tariffs; BYD's non-plate-month share stabilises above 3.5%, and its full-year share in 2027 could rise to around 5%. In the base scenario, the ZEV 2030 target is lowered to around 50%, the ECG still does not cover BYD, and tariffs are either not imposed or raised only slightly; BYD's share stabilises at around 4% and sales grow modestly. The report regards this as the most likely scenario. In the pessimistic scenario, the UK imposes higher tariffs on Chinese-made electric vehicles and UK–China relations become strained; sales of BYD's battery-electric models fall, plug-in hybrid and European-built models become more important, and share could fall back to around 2.8%.

Figure 4 BYD UK full-year market share: three scenarios (illustrative)

No policy forecast, just a range; where it lands depends on the five signals in Chapter 5

Sources: BYD UK Media, SMMT (2024–2026 are author's calculations); 2027 values are scenario assumptions, not forecasts

Table 6-1 Triggers, signals and responses for the three scenarios

Scenario	Trigger conditions	Early signals	Impact on BYD UK	Response preparations
Optimistic: sustained high growth	ZEV target largely unchanged; no additional tariffs	Consultation outcome retains the 80% target; non-plate-month share stabilises above 3.5%	2027 share rises to around 5%	Continue expanding the sales network and increase investment in fleet business
Base: slower growth (most likely)	ZEV target lowered to around 50%; ECG still does not cover BYD; no or only slight additional tariffs	Consultation outcome adopts the 50% option; overall battery-electric share growth slows; competitors' discounts decrease	Share stabilises at around 4%, with modest sales growth	Rely on plug-in hybrid models and total-cost-of-ownership advantages to stabilise share
Pessimistic: growth stalls	The UK imposes higher tariffs on Chinese-made electric vehicles; UK–China relations deteriorate	The government announces a tariff proposal or opens a formal investigation; BYD UK raises prices	Battery-electric sales fall; plug-in hybrids and European-built models become more important	Assess the feasibility of supplying the UK market from the Hungarian plant and prepare pricing contingency plans

To judge which scenario the market is moving towards, this report recommends tracking five indicators after each monthly SMMT data release (usually around the 4th of each month): BYD's market share in non-plate months; the overall UK battery-electric share and its gap to the ZEV target; the outcome of the ZEV consultation and progress on regulatory amendments; tariff-related reports and formal government documents; and changes to the list of models eligible for the ECG. These indicators have been built into

page 5 of the Power BI dashboard (Appendix Figure A5). Each signal shows its latest value, the optimistic and pessimistic criteria and the current reading, and the "current scenario" on the dashboard's home page is determined automatically from the five signals; it currently reads "Base: growth slows".

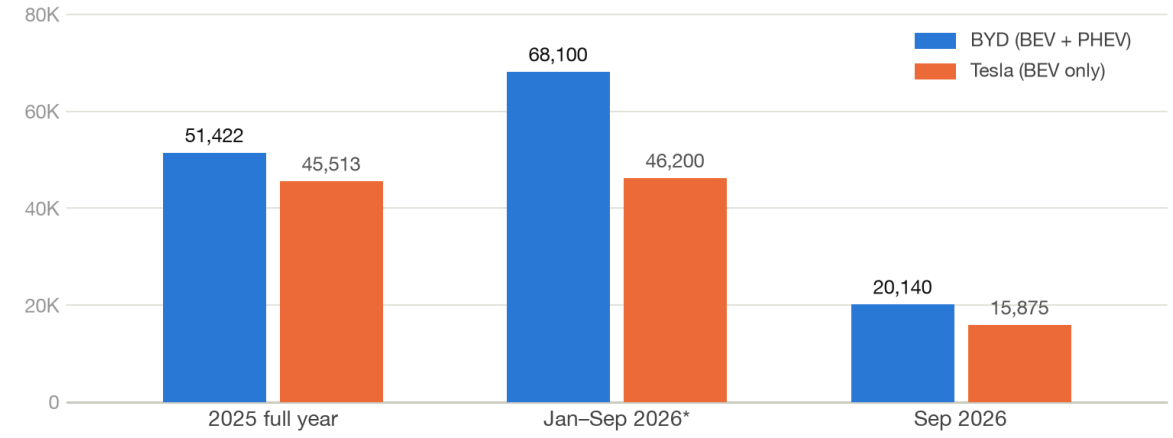

Chapter 7 Product Positioning and Pricing Strategy: A Comparison with Tesla

7.1 Market Performance of BYD and Tesla

During my studies in Bristol, I observed that BYD and Tesla electric vehicles appeared in roughly equal numbers on local roads. Among the consumers the author spoke to, BYD was generally seen as the better-value choice, while Tesla was seen as more technologically advanced and stronger in brand influence. Registration data show that BYD's UK sales have overtaken Tesla's (Figure 5, Table 7-1): in 2025 BYD registered 51,422 vehicles against Tesla's 45,513, and in January–September 2026 the two registered approximately 68,100 and 46,200 vehicles respectively. In the European market as a whole, both had a 2.4% share in the first half of 2026 (eletric-vehicles.com, 2026c). It should be noted, however, that BYD's registrations include plug-in hybrid models whereas Tesla sells only battery-electric vehicles; if only battery-electric vehicles are compared, the gap narrows markedly, so the conclusion that "BYD outsells Tesla" must state the basis of measurement.

Figure 5 BYD vs Tesla: UK new-car registrations

BYD leads on total volume, but that includes plug-in hybrids; on battery-electric alone the gap would be much smaller

Sources: BYD UK Media, SMMT, press reports, 'Six Questions' Q6; * BYD Jan–Sep is author's calculation; Tesla ≈46,200 is a media estimate

Table 7-1 Key indicators for BYD and Tesla

Indicator	BYD	Tesla	Source
UK registrations, 2025	51,422	45,513	(Batchelor, 2026); Answers to Six Questions, Question 6

Indicator	BYD	Tesla	Source
UK registrations, January–September 2026	approx. 68,100	approx. 46,200	(BYD UK Media, 2026b; Cathay EV, 2026; eletric-vehicles.com, 2026a) (author's calculation)
UK registrations, September 2026	20,140	15,875	(BYD UK Media, 2026b; eletric-vehicles.com, 2026a)
European share, first half of 2026	2.4% (174,144 vehicles)	2.4% (170,351 vehicles)	(eletric-vehicles.com, 2026c)
Product mix	Battery-electric + plug-in hybrid	Battery-electric only	—

7.2 BYD's UK Model Price Distribution

To judge whether BYD should stick to a price-led approach or move upmarket, it is first necessary to understand where its current models sit in the UK market in terms of price, and which models UK consumers actually choose. Table 7-2 lists BYD's main models on sale in the UK and their starting prices. BYD's range spans a wide price band, from the Dolphin Surf at £18,650 to the Sealion 7 at about £47,000, and it enters the luxury market above £95,000 through its sub-brand Denza.

Table 7-2 BYD's main UK models and starting prices (2026)

Model	Powertrain	Segment	Starting price	Price tier
Dolphin Surf	Battery-electric	City car	£18,650	Low
Dolphin G DM-i	Plug-in hybrid	Small car	£23,990	Low
Atto 2 DM-i	Plug-in hybrid	Small SUV	£26,995	Lower-mid
Sealion 5 DM-i	Plug-in hybrid	Family SUV	£29,995	Mid
Seal U DM-i	Plug-in hybrid	Mid-size SUV	£33,205 (launch price)	Mid
Seal 6 DM-i	Plug-in hybrid	Saloon / estate	£33,990	Mid
Atto 3	Battery-electric	Compact SUV	£38,990	Upper-mid
Seal	Battery-electric	Saloon	£45,730	High
Sealion 7	Battery-electric	Large SUV	£46,990	High
Denza Z9 GT	Plug-in hybrid /	Luxury estate	£95,000 / £105,000	Luxury

Model	Powertrain	Segment	Starting price	Price tier
	battery-electric			

Source: (chinacars.co.uk, 2026; Johnson, 2026; The EV Report, n.d.; Daly, 2026). Prices vary between sources owing to specification and promotions; starting prices are given here. For reference, the cheapest Tesla in the UK, the Model 3 Standard, starts at £37,990 (Cassey, 2026).

Combined with the sales data, three observations can be made. First, the bulk of BYD's sales is concentrated in the mid-price range: the best-selling Seal U DM-i starts at about £33,000, the Atto 2 DM-i, Sealion 5 DM-i and Dolphin G DM-i launched in 2026 are all priced between £24,000 and £30,000, and the September 2026 promotions also centred on these plug-in hybrid models (Johnson, 2026). Second, this price range closely matches mainstream UK demand. The leading models in UK sales in January–July 2026, such as the Ford Puma, Kia Sportage, Jaecoo 7 and Nissan Qashqai, are all mid-priced family SUVs (IOL, 2026). Third, BYD performs strongly among price-sensitive private buyers. Around 60% of new car registrations in the UK come from fleet customers (SMMT, 2026c), and fleet demand for battery-electric vehicles is driven mainly by salary sacrifice and benefit-in-kind (BIK) tax advantages; battery-electric penetration among private buyers is only in the low teens of percentage points, and these buyers are more sensitive to list prices. Against this background, BYD became the best-selling brand among private electric vehicle buyers despite being entirely ineligible for the ECG grant (Hammond, 2026b), which suggests that its combination of price and specification is highly attractive to UK private consumers.

7.3 Weighing a Price-Led Approach against Moving Upmarket

On the basis of the above data, BYD's pricing strategy can be analysed from two angles. On the one hand, as between high-volume low pricing and higher pricing, the structure of UK demand supports BYD continuing to keep the mid-price range as the main source of volume. UK consumers are heavily concentrated in family SUVs priced at £25,000–£35,000, which is precisely the band in which BYD's plug-in hybrid range is densest; if BYD deliberately abandoned this band to move upmarket, it would lose its main current source of growth.

On the other hand, long-term reliance on low prices also carries clear risks. In the battery-electric market below £37,000, competing models such as the Renault 5, Kia EV3 and Ford Puma Gen-E can benefit from the ECG grant of £1,500–£3,750, and other Chinese brands are also pursuing aggressive pricing, so even if BYD cut prices further it might not gain a price advantage in this segment. At the same time, continued downward pressure on prices squeezes margins, which, with the parent company's net profit having fallen for consecutive periods, is detrimental to long-term profitability and investment in technology development. The author believes that, to remain competitive in the UK over the long term, BYD must rely on strong differentiating technologies, such as megawatt-level flash charging (about 70% of charge in 5 minutes), the second-generation Blade battery and the "God's Eye" advanced driver-assistance system. If these technologies are brought to the UK and recognised by consumers, they

would shift BYD's image from "cheap" to "reasonably priced and technologically leading", thereby supporting more stable pricing.

Taken together, BYD's sensible choice in the UK is not a binary one between "low-price volume" and "moving upmarket", but a tiered strategy: hold the sales base with plug-in hybrid SUVs priced at £24,000 –£40,000; avoid a price war in the entry-level battery-electric market, where competition over the ECG grant is fiercest; use technologies such as ultra-fast charging and intelligent driving to support the value of mid-to-upper-range battery-electric models; and leave the premium market to Denza, so as not to dilute the value-for-money positioning of the BYD main brand. Denza opened orders in the UK in 2026, with its Z9 GT starting at £95,000, and introduced flash-charging technology of up to 1,500 kW to the UK for the first time (Daly, 2026), which provides a showcase for BYD's technological image.

It must be stressed that more data are still needed for verification before a final judgement can be made. Publicly available information currently provides only model starting prices and information on a few best-selling models; data are still lacking on actual transaction prices, specification mix, model-level sales to fleet and private customers, and the reasons why consumers choose BYD or Tesla. The conclusions of this chapter are judgements based on limited data; if BYD UK's internal sales data or consumer survey results become available, they could be used to test further whether the tiered strategy above holds.

Chapter 8 Conclusions and Recommendations

The analysis in this report indicates that BYD's rapid growth in the UK will most probably continue in the short term, but at a markedly slower pace, and that the sustainability of that growth depends mainly on the external policy environment rather than on the company alone. BYD's growth is highly concentrated in plate-change months, with a baseline share of about 3% in non-plate months; the main growth drivers are the absence of UK tariffs, the market expansion brought by the ZEV mandate, and a product mix that runs battery-electric and plug-in hybrid models in parallel; the main risks come from a lowering of the ZEV target, the exclusion of BYD from the ECG grant, and possible tariff policy. Of the three scenarios, the base scenario is the most likely, in which BYD's share stabilises at around 4% and sales grow modestly. On product strategy, the bulk of BYD's sales closely matches mainstream UK demand, but long-term reliance on low prices is unsustainable, and differentiating technology is needed to support product value. On the basis of these conclusions, this report makes the following three recommendations.

First, BYD UK should establish a "policy signals dashboard" to judge monthly which scenario the market is in. The three major risks identified in this report all originate in policy, and all are expected to see new developments in 2026–2027; it is therefore necessary to include the five indicators proposed in Chapter 6 in routine monitoring, updating them within two working days of each monthly SMMT data release, and to provide an estimate of the impact on sales within one week of any policy change. A prototype of the dashboard has been completed (Appendix A) and can serve as the basis for implementation.

Second, BYD UK should use plug-in hybrid models and fleet customers as a business buffer. The best-selling model in the first half of 2026 was the plug-in hybrid Seal U DM-i, hybrid models can be sold until 2035, and the EU's additional tariffs apply only to battery-electric vehicles. Maintaining a balanced line-up of battery-electric and plug-in hybrid models, while expanding fleet business such as corporate vehicles and leasing companies, can reduce the impact of any single policy change on overall sales. The effect of this recommendation can be measured by the share of sales accounted for by plug-in hybrid models and fleet customers, with the aim that sales fall by less than the market average under a policy shock.

Finally, BYD UK should raise its share in non-plate months, and use total cost of ownership and its technological strengths to counter its disadvantage on grants. In June 2026 BYD's market share was only 2.93%, while the ECG makes competing models up to £3,750 cheaper, and the grant will continue until the 2028–29 financial year. In non-plate months, BYD UK can emphasise 5 years of free servicing, an 8-year battery warranty and finance options, explaining to consumers that over the whole ownership period BYD's total cost is no higher than that of competing models receiving the grant; at the same time it should accelerate the introduction and promotion in the UK of technologies such as flash charging and intelligent driving, so that consumers' reasons for choosing BYD are no longer limited to price. The aim of this recommendation is to raise the average non-plate-month share from the current figure of about 3% to above 3.5%.

Chapter 9 Research Limitations

This report has several limitations. At the data level, the monthly figures for January–February, April and July 2026 were derived by back-calculation and may be out by several hundred vehicles, and first-half registrations differ by about 200 vehicles between sources; the full-year forecast of 85,000–90,000 vehicles is a rough estimate, and actual fourth-quarter performance may deviate from it; public sources lack a breakdown of BYD UK's sales between battery-electric and plug-in hybrid models and between fleet and private customers, as well as actual transaction prices and profit data for each model; and tariff-related information comes from media reports and has not been formally confirmed by the government. Because the data are highly time-sensitive, the conclusions of this report should be revised as the monthly data are updated.

At the level of conclusions, if the outcome of the ZEV consultation is more lenient than expected, or if tariffs are introduced quickly, the base scenario judgement will be too optimistic; conversely, if new models such as the Atto 2 and Dolphin G, or models equipped with flash-charging technology, perform strongly in the UK, BYD's growth may be faster and more durable than this report expects. In addition, if BYD is affected by the plate-change month effect more strongly than other brands, for example because it relies more on private buyers, assessing its stability on the basis of full-year share may overstate it. Finally, parts of Chapter 7 on consumer perceptions are based on the author's personal observations, with a limited sample, and may not be representative of the UK as a whole.

Appendix A Power BI Dashboard (BYD UK Growth Monitor)

To turn the analysis in this report into a tool that can be used continuously, the author built a Power BI dashboard, "BYD UK Growth Monitor", based on the report's data. The dashboard has 7 pages, each answering a specific question, and each page title states that page's conclusion directly (Table A-1); page 5 is the "policy signals dashboard" referred to in Recommendation 1 of Chapter 8. The data used in the dashboard come from this report's data tables, SMMT monthly data as cited in the media, BYD UK press releases and policy documents published on GOV.UK, and each data item retains its source reference number and confidence level.

Table A-1 Dashboard page structure

Page	Question answered	Page title (conclusion)
Overview	Where is BYD UK now?	Strong growth, rising policy risk
Growth	How fast is growth?	From ~1,150 cars to a forecast ~87,500 in four years
Seasonality	Is growth balanced?	Plate months drive more than half of 2026 sales
Policy	What could change growth?	The ZEV mandate pushes the market, but targets may be cut
Scenarios	What happens next?	Three scenarios for 2027, and the signals to watch
vs Tesla	How does BYD compare with Tesla?	BYD outsells Tesla in the UK, counting hybrids
Data	Can the data be trusted?	Every figure linked to a source ID and confidence level

Development environment and solutions. Because Power BI Desktop supports only Windows, the entire dashboard was built on a MacBook using Power BI on the web, and several limitations were encountered and resolved during development. The web version no longer supports uploading Excel files from a local drive, so the author stored the cleaned workbook on OneDrive and connected to it through Power Query Online, allowing the model to refresh from that file. When an entire worksheet was imported directly, the column names were lost; the author instead imported the formatted table objects in Excel, which preserved the headers and data types. Some dates were imported as Excel serial numbers (for example 45200), and the author added a step in Power Query to convert them to dates. In the web version, settings such as "sort by column", number formats and "do not summarise" are buried deep, so the author set them in bulk as text in the TMDL view instead; newly created calculated columns were

empty until the model was refreshed, a problem discovered when a donut chart returned an error and resolved by refreshing. Because the account language was Chinese, dates were initially displayed in formats such as "十月 2024", and changing the language setting altered only the personal view, so the author used FORMAT(Date, "mmm yyyy", "en-GB") to add an English date label column, making the report display consistently in any locale. In addition, building visuals one by one by hand was inefficient, so the author wrote the page layouts as report definition files in PBIR format and loaded them through Power BI's report file interface, cutting the build time for the 7 pages from several hours to a few minutes and making the layout fully reproducible. This process shows that, as long as the model and report are treated as files rather than merely as an interface for clicking, the web version can also support complete development.

Application of DAX measures. The dashboard keeps the raw data in data tables and concentrates all calculation logic in 27 measures, ensuring that every number on the dashboard comes from a single, tested definition. For core indicator measures such as Reg 2025 = CALCULATE(SUM(fact_UK_Annual[Registrations]), fact_UK_Annual[SortOrder] = 3), the author checked the results one by one against Python and SQL calculations, including 51,422 vehicles in 2025, 68,100 vehicles in January–September 2026 and the 5.9-fold growth multiple. Analytical measures turn the data into conclusions: Plate-month Share shows that March and September contributed 52% of January–September registrations, Non-plate Avg gives the baseline level for non-plate months, and ZEV Gap 2026 shows that the UK battery-electric share is 6.8 percentage points behind the ZEV target. Formatting measures (Annual Bar Colour, Month Bar Colour, Event Colour) return colour codes so that chart colours change automatically with the data, for example blue for plate-change months and grey for other months, and green for favourable and orange for unfavourable policy events, with no manual setting required. The Current Scenario measure counts the number of "optimistic" and "pessimistic" readings among the five early signals and determines the scenario accordingly, returning "Base: growth slows" by default; each month only one column of signal readings needs to be updated in Excel, and the scenario shown on the home page updates automatically. Text measures such as BYD Lead Label = FORMAT([BYD Lead YTD], "+#,##0", "en-GB") display results such as "+21,900" in a fixed English format.

From report conclusions to dashboard design. The dashboard was designed starting from the written conclusions rather than from the charts. Each indicator card shows only one key figure with a short explanation (such as "≈5.9× the 2024 level"); colours have fixed meanings, with blue representing BYD and plate-change months, orange representing risk and Tesla, and grey representing neutral information; forecast and estimated values are shown in lighter colours, and each page lists its data sources in the footer, so as to reflect uncertainty honestly. The dashboard is positioned as a reusable management tool rather than a one-off report: the five signals and the scenario determination can be updated after each monthly SMMT data release, allowing BYD UK managers to judge which scenario the business is in and what preparations are needed in advance.

Dashboard pages. Figures A1–A7 are screenshots of the dashboard's 7 pages.

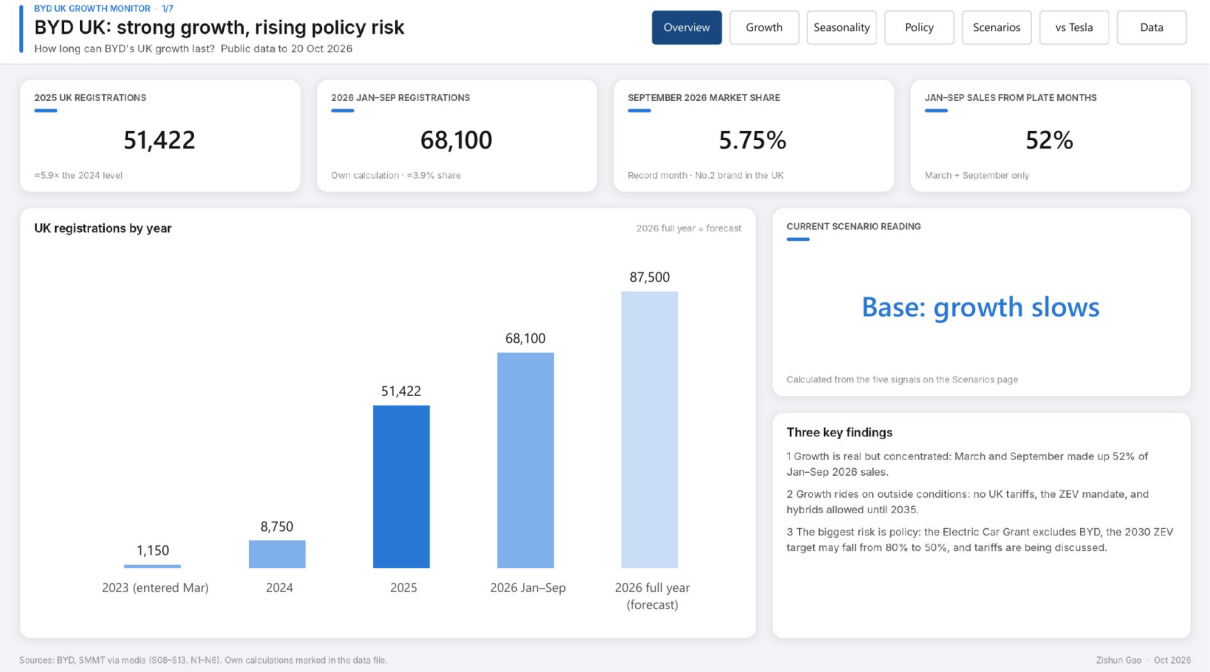

Figure A1 Overview: four key indicators, the annual trend and the current scenario determination, corresponding to the summary.

Figure A2 Growth: annual registrations; the lighter the colour, the lower the confidence level; corresponds to Chapter 3.

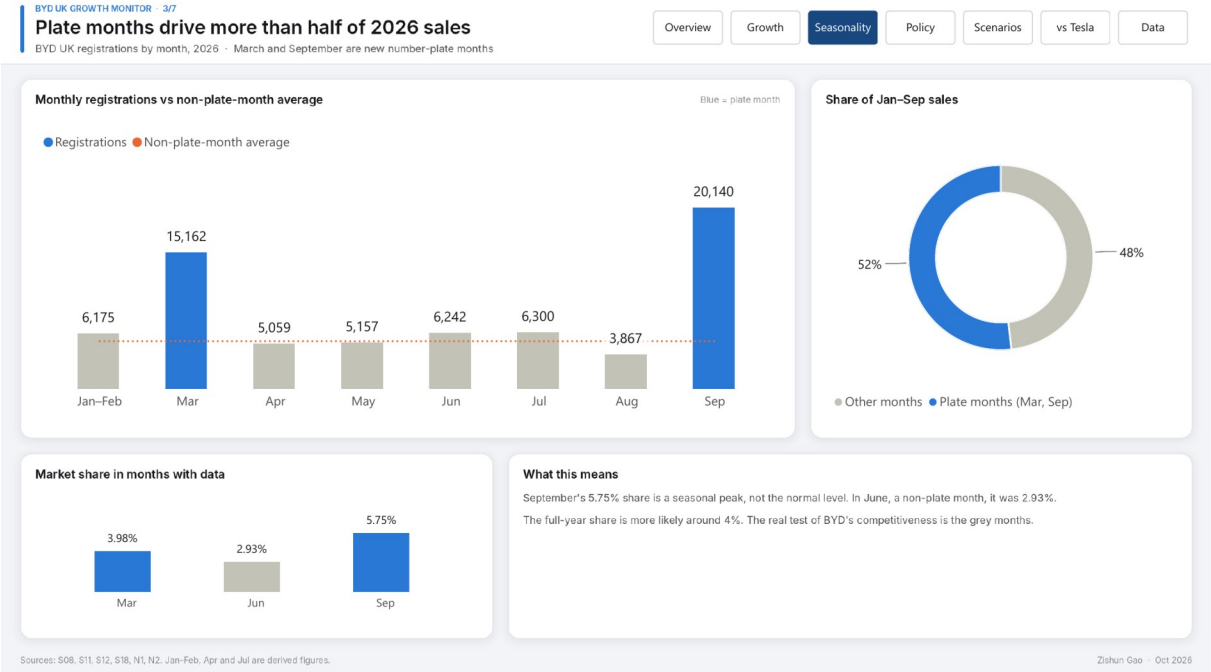

Figure A3 Seasonality: monthly registrations and the non-plate-month average line, corresponding to the analysis of the plate-change month effect in Chapter 3.

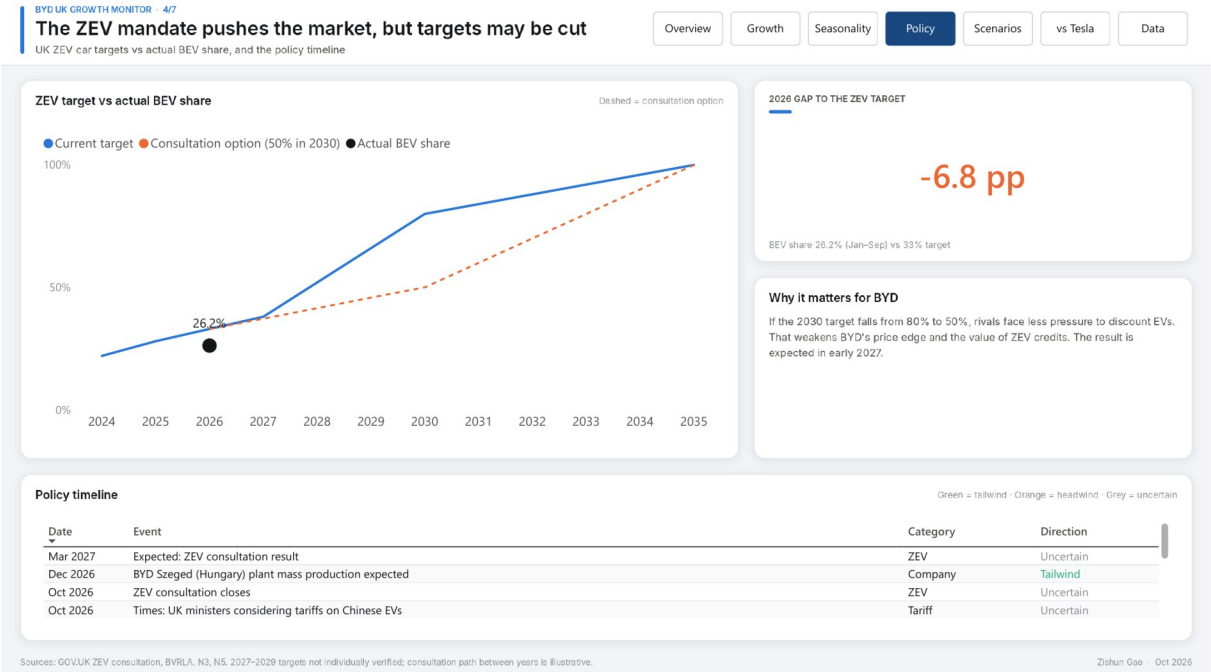

Figure A4 Policy: current ZEV targets, consultation proposals and the actual battery-electric share, together with a timeline of policy events; corresponds to Chapters 4 and 5.

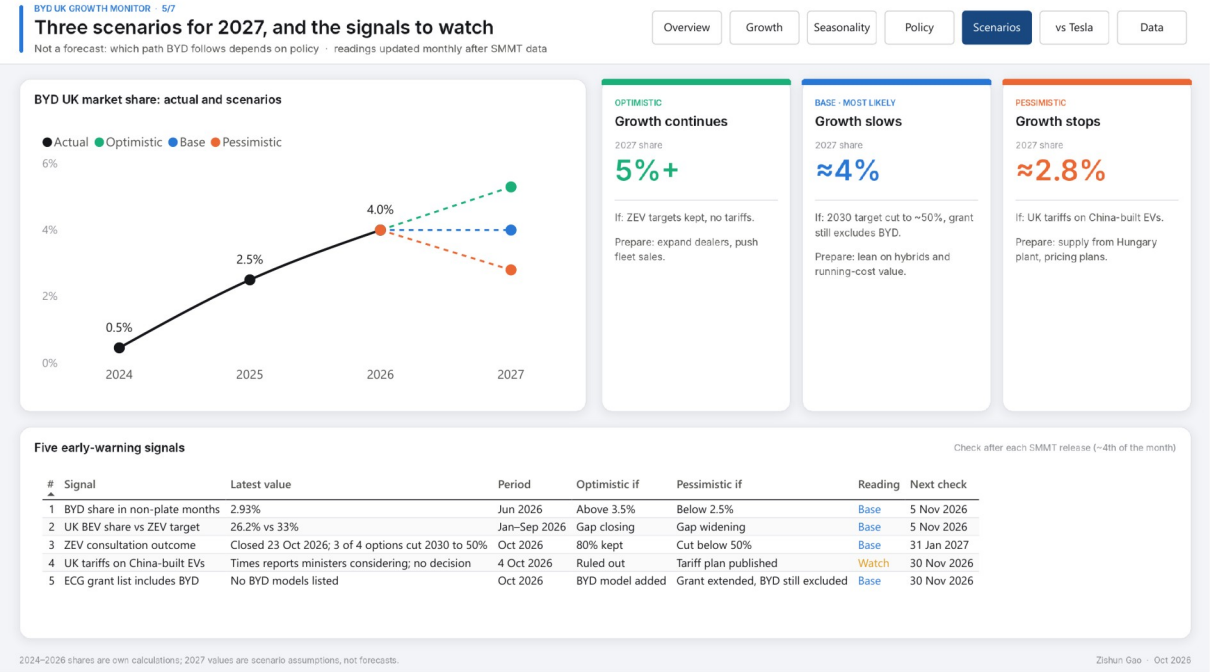

Figure A5 Scenarios: the three scenarios and the five early signals, corresponding to Chapter 6 and Recommendation 1 of Chapter 8.

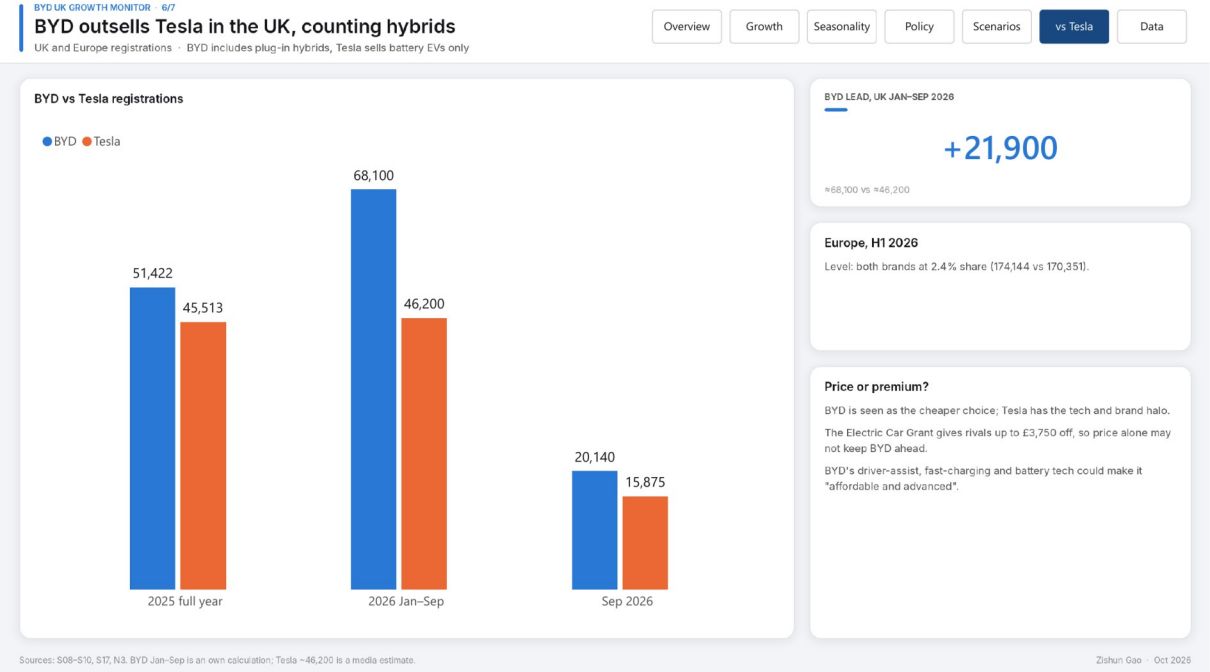

Figure A6 vs Tesla: comparison of BYD and Tesla registrations in the UK, corresponding to Chapter 7.

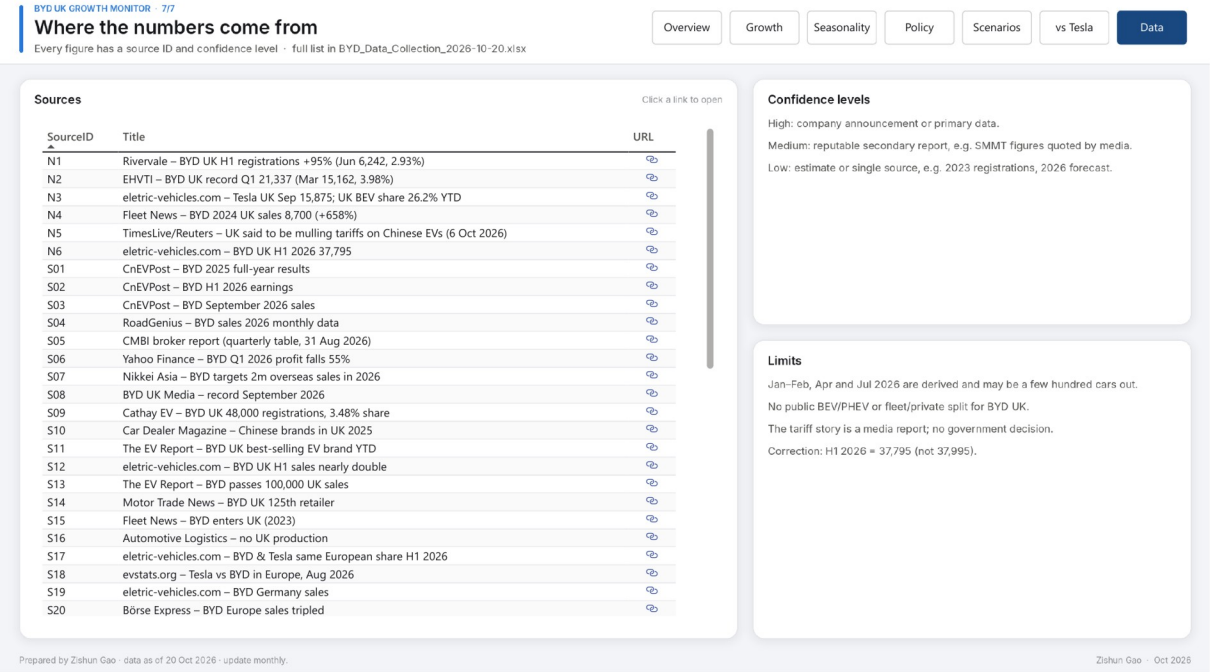

Figure A7 Data: list of sources, confidence level grading and data limitations, corresponding to Chapters 2 and 9.

How to access the dashboard. The interactive version of the dashboard was built in Power BI using a University of Bristol account and can be shared on request; a complete exported version of all 7 pages is attached to this report (BYD_UK_Growth_Monitor_final.pdf).
